Caterpillar welcomes additional “Best Practice” recommendations from our dealer network.

1.0 Introduction

Developing and using a standard “must do” parts lists for common CRC component rebuilds is an important step in the rebuild process. Rebuild kits standardize the rebuild process by reducing mechanic time spent ordering parts, reducing ordering errors, and allowing rebuild parts to be pre-ordered. These effects overall reduce the work in process turnaround time.

This “Best Practice” describes how Finning Chile develops, manages, and uses standard major component rebuild kits.

Rebuild kits for 992G and 793C final drives

2.0 Best Practice Description

Dealer uses two sources of information to create “must do” parts lists for component rebuilds. The list becomes an “electronic” kit” which is set up in their DBS Standard Jobs.

The must do parts lists come first from Builder files on DBS. The 100% parts usage file becomes the first source of information. The second source is the technicians / supervisors. Both the parts list from Builder and a list from the CRC technicians are independently developed, and then merged into one list.

The objective is to create standard parts list for all component rebuilds machine models and components that are performed in the shop. Developing the kits is prioritized. High volume components that go through the shop are developed first, followed by lower volume rebuilds.

3.0 Implementation Steps

Steps to implement “Standard Rebuild Kits” are as follows:

- Determine priorities. Decide which machine model components represent the highest rebuild volume. Identify the machine model, serial number prefix, and major component part number. In some cases, the dealer uses a Reman (OR) major component part number instead of a new part number.

FAMILIA	MODELO	SERIE	CO	DI	MF	TR	MO	FR	Susp	Susp	MA

- Build the Must-Do parts list – parts that are always replaced during a rebuild. First, have the CRC technicians or area supervisors create a parts list for a specific component. This can be done electronically or on paper. Finning creates a parts list from SIS and it is printed for the technician. Specialized technicians from the shop select Must Do parts from the paper copy. To maintain the standardized “Must Do” List electronically and make it available in DBS, an electronic list is made from the parts selected by the mechanic. Standardized parts are then already highlighted on the SIS printout. During component disassembly, technicians need only to order additional parts required to rebuild the component, such as those missing, worn, or damaged.

The technicians mark the parts that should be in the standard rebuild kit. Part numbers that are part of a Caterpillar kit, such as gasket kit or bearing kit, are indicated with a "K".

Next, the Builder program files are downloaded from DBS. The 100% replace parts list is downloaded.

The list from Builder and the electronic list created from the shop are merged into a single "Must Do" kit.

An electronic parts list is created and entered into DBS as a Standard Job.

A standard job parts list has now been created and available in DBS. After that, when a work order is opened, the specific prefix and model enables the parts list to be ordered without a typing process. Administration is able to order all must do parts under one standard kit part list for overhaul.

4.0 Benefits

- Creates a standardized rebuild – does not depend on technician.
- Eliminates mistakes in the parts order, wrong part numbers, omissions, typing errors, etc.
- Automatically updates part number changes.
- Enables shop to pre-order parts for a scheduled rebuild – improves WIP turnaround.

5.0 Resources Required

- Each component Must Do kit requires 4 – 6 hours of administrative time to create and set up.
