1.0 Introduction

When a component needs to be rebuilt it is sent directly from the mine site to the Component Rebuild Center (CRC). It is important that the CRC keep photographic records of the condition of the component as it was received from the courier company. The main purpose of this documentation is to permit technicians, supervisors, shop chiefs, engineers and all interested parties to have photographic record of reception and dispatching of components.

Sometimes the assembly area needs to know how the component was received. For instance, parts were not sent or parts were missing upon receipt. They have access to this information by consulting work order photos.

This Best Practice is designed to support CRC Shops with managing photos taken upon reception and dispatching of components.

2.0 Best Practice Description

In the past, the CRC would use 35mm film cameras to document the reception and dispatching of components. These photos were stored in a filing cabinet, which limited access to them to only one person or group at the same time. This also incurred costs such as, film developing, storage and a dedicated person for administration.

Later, digital cameras were used for documentation and the photos were stored in folders on a network drive. This enabled the photos to be more readily available and eliminated some of the before costs. However, some photos were misplaced or accidentally deleted.

In order to manage the digital photos in a more efficient manner, the *Work Order Photos Administration System* software was implemented. Technicians have this software available in the SIS WEB Workstations located in the CRC. This software helps manage photos of components taken in the reception and dispatch area. Photos are uploaded to the software, classified by work order and type of photo (reception or dispatch). The software shows detailed information of the work order alongside each photo and multiple users can view the same photo simultaneously. Additionally, the software lists all work orders that do not have photos associated with them. This greatly reduces the audit time in the reception and dispatch area.

The process begins when the reception and dispatch clerk takes photos of the components (Figure 1).

The reception and dispatch clerk downloads photos from the camera and uploads them to the system (Figure 2). The photos can then be viewed (Figures 3&4).

3.0 Implementation Steps

- Gather information on the volume of the photos taken each day to establish picture format and maximum size.
- Create the database and the folders to save the data.
- Install the *Work Order Photos Administration System* Software.
- Conduct training for the reception and dispatch clerk and other users (Service Engineers, Shop Chiefs, etc.).

The *Work Order Photos Administration System* can also be implemented in the Service Shops.

4.0 Benefits

- Minimize the time required to access work order photos.
- Provide a more effective way to search for specific component photos.
- Avoid the loss or handling of photographic records by the users.
- Online report of the work orders without photos allowing better control of the process by reducing audit time.
- Allows simultaneous users to view the same picture.

5.0 Resources Required

- A digital camera.
- *Work Order Photos Administration System* Software.
 - Contact Dayana Saavedra to obtain a free copy (see section 8.0).
- A web server with IIS running to host the application, disk space and a database manager (Example: SQL Server).
- Time for training.
