DISCLAIMER: The information and potential benefits included in this document are based upon information provided by one or more Cat® dealers, and such dealer(s) opinion of “Best Practices”. Caterpillar makes no representation or warranty about the information contained in this document or the products referenced herein. Caterpillar welcomes additional “Best Practice” recommendations from our dealer network.

1.0 Introduction

CRC processes and uninterrupted workflow are vital to optimizing component rebuild efficiency, component turnaround time, controlling costs, and maintaining quality. Process mapping is an important tool to help establish “as is” and “to be” processes.

This Best Practice discusses Ferreyros program using portable video cameras in the CRC to document the actual processes, study bottlenecks, determine root causes for delays and waste, and develop a Continuous Improvement plan.

2.0 Best Practice Description

Dealer uses video cameras to study specific areas of activity in the CRC. The time and motion activity is recorded over a period of time and reviewed by a CI team.

The video can be fast-forwarded to significantly shorten the time required to study the processes. The cameras are mounted on an adjustable stand which can be easily moved and relocated anywhere in the shop. They are used to study general processes as well as specific situations where an improvement is desired.

3.0 Implementation Steps

- Dealer needs to have a Continuous Improvement manager or 6 Sigma Black Belt responsible for CI in the CRC.
- Cameras, stands, and recording equipment are purchased commercially.
- CI team needs to be familiar with 6 Sigma, Lean process management, and other process analysis techniques, such as Caterpillar Production System

CPS for Dealers – Deployment Resources:

4.0 Benefits

- Useful analysis tool for Continuous Improvement efforts
- Captures processes as they really happen.
