Caterpillar welcomes additional “Best Practice” recommendations from our dealer network.

1.0 Introduction

Most vertical parts washers are up to 14 feet tall and used to clean engine blocks, spindles, or baskets containing piece parts. Most have the pumps and motors contained in the bottom of the washer cabinet with an additional base that is typically 3 feet high. As a result, the loading platform of the washer is 4 to 5 feet above the floor level.

The height of the platform above the floor level increases the time and effort required to load and unload parts and components

Increased height
of the floor to
the platform

2.0 Best Practice Description

A quick and simple way of improving the of lifting and handling parts mount the washer is a “silo” or pit in the floor so that the load platform is close to floor level. The silo will need to be large enough to provide access to the base of the washer for routine maintenance and repair. The exposed silo area can be covered with removable grating.

It is important to design access to the washer base for routine servicing.

3.0 Implementation Steps

Construct a silo considering the dimensions of the washing machine so that the loading platform is located at the height of the floor. Several dealers who have implemented this practice have been very pleased with the benefits.

4.0 Benefits

- Reduces the time of entry and exit of components to the washing machine.
- Improves technician ergonomic.
- Reduce time for cleaning the solvent tank.

5.0 Resources Required

Construction of silo.

6.0 Supporting Attachments / References

None

7.0 Related Best Practices
